

#### Journal Week 1:

During week one we created the boilerplate/template to begin coding on. We had one long scrolling page with multiple sections that could be edited individually. We chose our color template, and created the text sections of our home page and event page. This includes linking some of the most popular events that our plates would be attending. At this point our code is nearly 100% html.

#### Journal Week 2:

Throughout week two, we worked to split our current website template up into multiple pages as compared to the initial single webpage. As a result of this, we had to remake our navigation bar to fit all the parameters of these new pages. Furthermore, we finalized our more basic pages, those being our homepage and our events page. We have yet to complete our php and javascript requirements. We made our own sql database to apply for the extra credit.

#### Journal Week 3:

Through the final week of our project, we worked double time to finish our javascript and php/sql elements. We finalized our players page using a javascript flexible slideshow. We also doubled down and created a brand new page of the shop page, also using java. Lastly we finished up our php page to correctly display our sql database. Up until a few hours ago, our sql page was horrendous with minimal css. Finally, we added the remaining touches in terms of content, photoshopping our faces onto our slideshow.
